

Milestone 1:

Increase the usage of voice input on the ChatGPT mobile app.

India's Voice Interaction Landscape: Rising Demand, Real Engagement.

- India leads globally in voice-based system interactions, with over 28% of Google searches now voice-triggered – mainly from Tier 2 & 3 users.
- Voice notes dominate communication on WhatsApp, Telegram – especially in local languages and low-literacy user groups.
- Usage of virtual assistants (Google Assistant, Alexa) is rising for tasks like infotainment, reminders, and smart home control.
- Growth driven by:
 - Rising smartphone penetration in semi-urban and rural Bharat
 - Better voice recognition in Indian languages (Hindi, Telugu, Tamil, etc.)
 - Platforms like ShareChat and KukuFM are leveraging voice for engagement. They serve as strong indicators of user comfort with speaking and listening to digital systems.
- Barriers: Accent accuracy, low awareness, and privacy concerns using voice in public.

Conclusion: Voice-based interaction is not just an accessibility feature – it's fast becoming a primary mode of engagement for India's next billion users.

So even those who don't type in English (or type at all) can interact fluently via voice.

Example: A farmer or homemaker in rural India could speak to ChatGPT in Hindi or Telugu to get answers—something they wouldn't do in text format.

Where do people use voice search?

How Much Users Trust Voice Assistants To Provide Accurate Information

Source: NP Digital. From a survey of 1000 U.S. individuals, 18-65, all which use voice search at least a few times per month.

High trust in voice assistants validates future potential of ChatGPT voice chat.

Insights from Analysing ChatGPT’s Current UX and Comparable Voice Apps

User Experience Insights from ChatGPT Voice (iOS & Android)

- ChatGPT is best for voice chat because it offers the most natural, human-like conversational flow and personality, outperforming Gemini's flat tone and Claude's limited dialogue engagement
- Users find multi-voice options engaging, but some want regional or multilingual voice choices for greater relatability and diversity (especially among Indian users). Regional languages need improvement.
- A few users express confusion around when to use voice vs. text – especially in professional or public settings.
- UX drawback: No onboarding or contextual nudges guiding users to use the voice feature, despite it being powerful.
- Power users like the hands-free convenience but wish for longer memory/contextual follow-up, especially during multitasking.

Comparison with Direct Competitors

Perplexity AI

- Strong voice onboarding – clearly prompts users with pop-ups like “Try our voice mode”.
- Clean voice UX but more oriented towards search-style answers, not deep conversations.
- Often lacks personality or continuity across long interactions.

Google Gemini

- Gemini Voice feels fast but more robotic.
- Occasionally confuses commands or lacks deep dialogue context.
- UI is clean but minimal, and voice doesn’t feel central yet – more like a feature than a core interaction method.

Siri / Google Assistant

- Highly polished voice UX, but not LLM-powered in the same depth.
- Used mainly for commands or quick tasks, not exploration or reasoning.
- Users often view them as tools, not "agents you can talk to".

Why increasing voice usage on ChatGpt matters as a product outcome.

Differentiates ChatGPT:

Voice interaction offers a more natural, human-like experience – setting ChatGPT apart from static text-based tools.

Attracts New User Segments:

Users currently relying on tools like Google Assistant for research or quick answers may switch once they see that:

- ChatGPT offers follow-up, contextual, and conversational depth
- Responses go beyond just search snippets or surface-level summaries

Unlocks New Use Cases:

Voice enables hands-free, low-effort, and situational usage (e.g., commuting, multitasking, accessibility needs).

Drives Deeper Engagement:

Speaking feels more fluid than typing, encouraging longer, richer sessions and boosting overall retention.

Builds Stickiness and Loyalty:

Once users are comfortable with voice, it can become their default interaction mode, fostering recurring usage over other tools.

Strengthens the Model Improvement:

Increased voice usage improves real-world input for speech models – accelerating quality improvements.
